Assemble the cooling jig on either on the floor or on a flat table.

1. Loosely attach the side panels with the M6 button head screws (two screws per panel).

2. Gently place the rear hinged panel position so that the holes in the rear panel are near to the steel pins which project from the centre of the inside of the side panels.

3. After locating one of the pins on the side panels with the hole in the rear panel, tighten the two 6mm button head screws so that the side panel is firmly secured.

4. Now, locate the pin on the opposite side panel with the corresponding hole in the rear panel and tighten the two remaining 6mm button head screws, so that both side panels are firmly secured.
5. The rear hinged panel is adjustable through 180 degrees and is clamped in place at the desired angle by the two blue M6 star grip knobs, which are positioned at either side of the cooling jig through the slots in the side panels and into the hinged rear panel.

Final Cooling Jig
